1. Business Requirements

1.1 Background

It's been always a need for every student in An-Najah National University or an instructor or a worker to get their updates and notifications, Zajel Application unfortunately did not provide an easy, fast, and accurate way to get the last updates. Students and all workers who use Zajel will open Zajel and manually check each field or section, which is time consuming and it's not a smooth experience; especially in times when Zajel servers drop.

And here lies the real need to fix that problem, and we move to the next point.

1.2 Business Opportunity

As students and workers who use Zajel have no real notifications application that sends real-time, accurate, easy-to-read notifications, the system Zajel Reminder comes to fill that need, Zajel Reminder will solve the problem of not receiving the notifications, such as : general announcements from the university, exam results, signing courses, etc... .

At the current time there is no system or application that solves that problem, and Zajel Reminder is the first system who will solve the problem, we expect students and workers to welcome that decision with happy faces; as we saw in the forms that we collected and interviews that students see and believe that this system will be important and useful at the same time, students and workers believe that it's very important to integrate Zajel Reminder with Zajel to solve that problem.

1.3 Business Objectives

This system aims to reduce the problems that faces students and workers to receive the notifications and reading them in easy, concise, and accurate way, and it aims to share the load on Zajel servers, which also improves user experience.

This system aims to make the availability of the notification easier, for example : when students want to check their exam results, in Zajel they have to manually check it, instead, we will make this action with Zajel Reminder more concise, easier to get and read.

Also, this system aims to reduce the problems that faces the students when not receiving notifications, that will result in less complaints and creates a happy user experience.

1.4 Success Metrics

Success metrics in this system that is integrated with Zajel is based on a lot of factors that combine together to decide whether the system is successful or not.

- **Easy to use system :** The system shall be easy to use, and have nice experience, and interfaces that is relevant to the user.

- **Reports section :** If the system has bugs and errors, the user will provide the bug info to us, and our mission is to solve them without letting the user to experience pain in the system.
- **Notifications success :** The user should receive the correct notifications in the correct order, and time, without putting effort on user to get it.
- **Number of User:** The number of users of the new system Najah Reminder relative to the number of Zajel users indicates that the goal that is achieved, and a lot of users predict that this system serves its purpose.
- **Forms :** Through forms we can collect people's opinion about the system, what is good ?, and what is bad ?, and what needs to be changed ?

ما مدى أهمية وجود سجل إشعارات في التطبيق؟

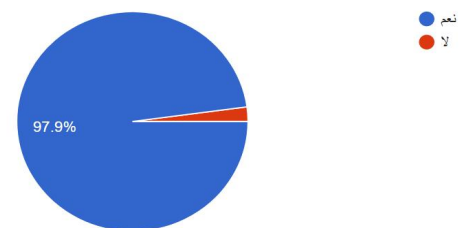

Figure 2: Importance receiving notifications quickly in Zajel Reminder

1.5 Vision Statement

Over the past years, all Zajel users suffered from not receiving updates and notifications when using Zajel, students, instructors, workers, etc... . This new system Zajel Reminder would be a great solution for these stakeholders suffering from inefficiencies in Zajel; Zajel Reminder will provide real-time notifications, great user experience, reducing dependency on Zajel to check updates manually; which reduces pressure on Zajel servers.

We expect users to have a surprising transformation, from Zajel with frustration to Zajel Reminder and convenience,

At the long-term vision we expect a positive impact on the system, and stakeholders, such as : improving academic notifications, and some other operations that relate to Zajel.

This vision achieves the business objectives that were written above, like: improving user experience and improving academic experience.

1.6 Business Risks

We have some challenges that have been identified as risks, like:

Integration with Zajel: Najah Reminder will be build as smooth experience system, and integration backend data from Zajel's servers could be inconcistant, which may result problems with fetching data into Zajel Reminder, and cause incorrect notifications, and create a feeling inside the user that this system isn't secure enough.

Low User adoption: There may be some stakeholders like: instructors, students, etc..., who used to manually check updates and notifications, which may result in a failure or a potential risk to the system, this can be solved with publishing some videos about the new system and how to use it; in order to spread awareness.

Privacy and cyber security: Knowing that Najah Reminder will work with sensitive data, and personal details, it could be vunrable to cyber attacks, which can be harmful for both: the system and stakeholders. It could be limited by using secure methods and encryption to protect the data and users.

System Drop Down: due to heavy load on Zajel Reminder servers it could crash down and stop for a while, in time of pressure, like: exam periods, course signing, etc...; which creates a time gap between the user and the notification.

University Rejection: Maybe the university won't accept that system, or simply gets rejected, which results in a complete stop in the project, and canceling it.

1.7 Business Assumption and Dependencies

Table 1 shows assumptions and dependencies for the Najah Reminder

Table 1: Assumptions and Dependencies

Type	Point	Impact	Plan	Related risk
Assumption	User demand for Notifications: Users will check their updates through the new system	Getting positive effect on students academic experience	Through forms and collecting opinions, like the forms we've collected	Low User Adoption, and the solutions is written above
Assumption	User prefrence to push Notifications	Receiving lastest updates in a more suitable way that user prefers	Developing the feature with pinpoint accuracy, real time updates, and easy user experience	Integration Problems
Dependency	Access To Zajel's backend and services	Vital for getting data and updates	Integrating both systems, and testing, and create secure API calls	Privacy and Cyber security

2. Scope and Limitation

Our proposed system Najah Reminder main aim is to have a friendly system that notifies students about new changes made to their account. That will be done by implementing system that is easy-to-use, user friendly, familiar with students needs.

Based on what we have collected from students from the form we've published, We plan to add real-time notifications, a place for the university's general announcements, a reminder if you didn't see the update or the notification, also a place where we can organize and reach all reminders and notifications, and also a reminder for the deadline date for assignments or projects, etc ..., an offline primary information mode, notifications reach on both (system & SMS), Specified updates and notifications, easy to reach notification and updates.

On the other side we have some limitations that maybe slows down or could possibly stop the project, Zajel's server integration with the new system could be hard, or impossible, we can't decide unless we talk with IT Department with the University. Also, Budget could strict our development cycle, or could boost it to a high level, it could also affect the availability of the notification to reach if it was an SMS. Maybe the university would reject the idea of this system.

2.1 Major Features

The Najah Reminder system will provide these core, Major features to deliver the features mentioned above; To achieve the goal of the system.

(Notifications & updates) system : A system that serves the purpose of fetching real-time notification and updates, including exam grades, Course Registration, General Announcements, Deadline Date for Assignments and etc,...

Reminder feature : A reminder for an activity or an announcement, unchecked notifications, A reminder to submit the assignment, a reminder for registering courses, reminder for unsubmitted official papers, A reminder before the Midterms or Finals, etc...

(Notifications & Updates & Reminders) Specifications : User can filter or read notifications based on filtering systems, that is collected and planned to read the intended notifications easily and make them more available and reachable.

SMS and offline Notifications : User Receives notifications and updates through SMS if they connect their Najah Reminder to a specific phone number, and also notifications reach the system at the same time.

Cross Platform System : User shall use the system on multiple platforms, since we have known that Zajel users use Zajel from different platforms.

Feedback and Bug Reporting : If users face problems (Bugs) or they have a recommendation for the system, they can send that feedback to us; To make users closer to developers.

2.2 Scope of Initial Releases

Table 2 shows the deature and it's percentage release, they are sorted relative to priority, which is linked with **section 3.2**

Table 2 : Each Major Feature and its release percentage

Feature	Release 1	Release 2	Release 3
(Notifications & updates) system	100%	-	-
Reminder feature	90%	100%	-
(Notifications & Updates & Reminders) Specefications	15%	65%	100%
SMS and offline Notifications	5%	50%	100%
Cross Platform System	5%	55%	100%
Feedback and Bug Reporting	-	40%	100%

2.3 Limitations and Exclusions

Connecting the new system with Zajel's backend : The integration between our new system and Zajel's servers could be hard and full of obstacles, and could possibly give wrong responses, or long response time, etc..., or it could not connect at the current time; due to Zajel's structure and code.

University's policies : The university could reject or put restrictions on the desired system; due to some policies that is related to user privacy, the university is not interested in this system for examle.

Budget : Budget could cancel or delay some core features in that system, which makes developing cycle harder, and take more time.

Users Acceptance: After releasing maybe first or second relase of the system, maybe users dislikes the new system, due to bugs or user experience problems.

They can report these problems onto Feedback and reports section, which was mentioned before.

3. Business Context

By providing real-time, user-friendly notifications to An-Najah National University staff, instructors, and students, Najah Reminder aims to solve the weaknesses of Zajel's manual notification process. This supports the system's goals of enhancing user experience, lowering complaints, and providing a smooth academic experience.

3.1 Stakeholder Profiles

Table 3 shows every stakeholder and their effect and expectations from the system.

Table 3: Stakeholders and their Effects and Expectations

Stakeholder	Effect	Expects
Students	Students are the most common user type in the system, they only receive notifications, updates, announcements, exam dates, etc...	Easy-to-Use system without the need to manually checking Zajel
Instructors	They are second most common user type, they also receive notifications, updates, etc..., they can be a cause of creating the notifications or changes	Easy-to-Use system without the need to manually checking Zajel,
University IT Team	They are the technical stakeholders for Zajel and Najah Reminder, they are responsible for fixing bugs and helping to integrate	They expect the system to be secure, bugs free, compatible with Zajel
University Administration	They are the decision makers, who approve every thing, accepting events and academic stuff, and resources	They expect the new system to fit university goals, improving students services level, keeping data secure
Development Team	They are responsible for designing, coding, fixing bugs and problems, testing	They hope to deliver a stable, good, easy -to-use system that matches all goals

3.2 Project Priorities

In section 2.2 in the table, the Major core features were sorted descendingly, starting from the highest all the way to lowest priority.
